

ISO 9001

ISO9001 CERTIFICATION ENSURES QUALITY PROCESSES!

What is ISO9001?

The International Organization for Standardization (ISO) is the specialized international agency for standardization, at present comprising the national standards bodies of 91 countries. The purpose of ISO is to promote the development of standardization and related world activities to facilitate the international exchange of goods and services, and to develop cooperation in intellectual, scientific, technological, and economic activity.

The ISO9001 series is a set of five individual, but related, international standards on quality management and quality assurance. They are generic, not specific to any particular products. They can be used by manufacturing and service industries alike. These standards were developed to effectively document the quality system elements to be implemented in order to maintain an efficient quality system within a company.

There are several benefits to implementing this series. For example, it guides you to build quality into your product or service and avoid costly after-the-fact inspections, warranty costs, and rework. ISO9001 is the most comprehensive quality system model for covering design, manufacturing, installation, and servicing systems.
